                        2025, 2:43 PM
             Duration
                        27 mins 33 secs
  Question 1
  Correct
  Flag question
    Given an array of numbers, find the index of
    the smallest array element (the pivot), for
    which the sums of all elements to the left
    and to the right are equal. The array may
    not be reordered.
    Example
    arr=[1,2,3,4,6]
          the sum of the first three elements,
    1+2+3=6. The value of the last element is 6.
          Using zero based indexing, arr[3]=4 is
    the pivot between the two subarrays.
          The index of the pivot is 3.
    Function Description
    Complete the function balancedSum in the
    editor below.
    balancedSum has the following
    parameter(s):
    int arr[n]: an array of integers
    Returns:
    int: an integer representing the index of the
    pivot
    Constraints
    • 3 \le n \le 10^5
          1 \le arr[i] \le 2 \times 10^4, where 0 \le i < n
          It is guaranteed that a solution always
    exists.
    Input Format for Custom Testing
    Input from stdin will be processed as
    follows and passed to the function.
    The first line contains an integer n, the size
    of the array arr.
    Each of the next n lines contains an integer,
    arr[i], where 0 \le i < n.
    Sample Case 0
    Sample Input 0
    STDIN Function Parameters
    4
         \rightarrow arr[] size n = 4
         \rightarrow arr = [1, 2, 3, 3]
    1
    2
    3
    3
    Sample Output 0
    2
    Explanation 0
          The sum of the first two elements,
    1+2=3. The value of the last element is 3.
          Using zero based indexing, arr[2]=3 is
    the pivot between the two subarrays.
          The index of the pivot is 2.
    Sample Case 1
    Sample Input 1
    STDIN Function Parameters
         \rightarrow arr[] size n = 3
    3
    1
         \rightarrow arr = [1, 2, 1]
    2
    1
    Sample Output 1
    1
    Explanation 1
          The first and last elements are equal
    to 1.
          Using zero based indexing, arr[1]=2 is
    the pivot between the two subarrays.
          The index of the pivot is 1.
    Answer: (penalty regime: 0 %)

  Question 2
  Correct
  Flag question
    Calculate the sum of an array of integers.
    Example
    numbers = [3, 13, 4, 11, 9]
    The sum is 3 + 13 + 4 + 11 + 9 = 40.
    Function Description
    Complete the function arraySum in the
    editor below.
    arraySum has the following parameter(s):
    int numbers[n]: an array of integers
    Returns
    int: integer sum of the numbers array
    Constraints
    1 \le n \le 10^4
    1 \le \text{numbers}[i] \le 10^4
    Input Format for Custom Testing
    Input from stdin will be processed as
    follows and passed to the function.
    The first line contains an integer n, the size
    of the array numbers.
    Each of the next n lines contains an integer
    numbers[i] where 0 \le i < n.
    Sample Case 0
    Sample Input 0
    STDIN Function

            printf("%d", arraySum(5, arr))
     Passed all tests! <
  Question 3
  Correct
  Flag question
    Given an array of n integers, rearrange them
    so that the sum of the absolute differences
    of all adjacent elements is minimized. Then,
    compute the sum of those absolute
    differences. Example n = 5 arr = [1, 3, 3, 2,
    4] If the list is rearranged as arr' = [1, 2, 3,
    3, 4], the absolute differences are |1 - 2| = 1,
    |2 - 3| = 1, |3 - 3| = 0, |3 - 4| = 1. The sum of
    those differences is 1 + 1 + 0 + 1 = 3.
    Function Description Complete the function
    minDiff in the editor below. minDiff has the
    following parameter: arr: an integer array
    Returns: int: the sum of the absolute
    differences of adjacent elements
    Constraints 2 \le n \le 105 \ 0 \le arr[i] \le 109,
    where 0 \le i < n Input Format For Custom
    Testing The first line of input contains an
    integer, n, the size of arr. Each of the
    following n lines contains an integer that
    describes arr[i] (where 0 \le i < n). Sample
    Case 0 Sample Input For Custom Testing
    STDIN Function ---- 5 \rightarrow arr[] size
    n = 5.5 \rightarrow arr[] = [5, 1, 3, 7, 3] 1 3 7 3
    Sample Output 6 Explanation n = 5 arr = [5,
    1, 3, 7, 3] If arr is rearranged as arr' = [1, 3,
    3, 5, 7], the differences are minimized. The
    final answer is |1 - 3| + |3 - 3| + |3 - 5| + |5 -
    7| = 6. Sample Case 1 Sample Input For
    Custom Testing STDIN Function -----
    -- 2 → arr[] size n = 2 3 → arr[] = [3, 2] 2
    Sample Output 1 Explanation n = 2 arr = [3,
    2] There is no need to rearrange because
    there are only two elements. The final
    answer is |3 - 2| = 1.
    Answer: (penalty regime: 0 %)
